

ABSTRACT

A medical flushing and suctioning device for flushing and suctioning off body areas in an operating area is described, which consists of a flushing and suctioning lancet and a connected valve arrangement with switchable valves, which depending on the valve position supply a
5 flushing fluid to the flushing and suctioning lancet or switch the lancet into a suctioning function.
For improved handling of the device, the invention provides that all functional parts are combined in a device that can be manually held.
